Reflection: Benefits of Gamification in Online Higher Education

Daniel A. Kaufmann

Grand Canyon University
Abstract

The current article presents a reflective account of how gamification can help students overcome complex academic challenges, such as those involved in the dissertation process and other elements of higher learning. Gamification has been shown across multiple levels of academic instruction to have a positive impact on task completion by augmenting the experiential elements encountered by students who are engaging in the process of learning. When a task becomes mundane, it typically lacks any semblance of a positive feedback loop, which results in it becoming easier for a person to put off their intended task, and even forget to return to the activity prior to a deadline. For many online learners, they participate in their degree programs in the midst of highly involved personal schedules, which can lead to lapses in organization and reduced performance as a student. Many applications currently exist with potential promise for improving the levels of fun, engagement, motivation, and task completion in various areas of daily life. With deliberate decisions from online faculty, it makes sense that an integration could be possible between these applications and existing online curricula to help bridge the gap for many students between passive stagnation in a given course, and active engagement in the course material to a point of tangible increase in grades earned, and course-wide success among course participants.
INTRODUCTION

In online higher education, students are commonly expected to overcome obstacles not typically experienced by their face-to-face counterparts (Gillett-Swan, 2017). These can include isolation, lacking of a physical learning environment (Kortemeyer, 2016), additional work or family commitments, time management concerns, being off campus, and the assumption that the student is capable of being a reliable and independent learner (Karen, 2004). In fact, a student must be capable of completing tasks in a timely manner, and with high efficiency and mastery of related materials, in order to excel in higher education of any kind. While different styles of student motivation do exist, it is commonly understood that many students will engage in a “ramping-up” process prior to course deadlines (Urban, 2016). This means, the majority of the work is done in closer proximity to the deadline for the required task. What, then, happens to students who reach a level of education in which there is no externally assigned deadline (a la, dissertations)?

Games have been used throughout human history to assist people in overcoming high levels of discomfort. During the reign of King Atys of Lydia, an 18-month famine fell across the land at a time when sufficient food stores had not been preserved for this level of catastrophe (Herodotus, 2003). The solution for the people of Lydia was to eat only every other day. This may seem like an incomprehensible feat for any people intimately connected to their usual cravings for food on a three-meal-per-day cycle. However, the Lydian people were able to transcend their needs for food by spending the entire second day playing games. This assisted their ability to focus on parts of their experience which were not cyclically devoted to their normal patterns of eating; achieving a level of mindfulness which allowed the task at hand to fade into the background of their present focus. Games in modern times can be used for similar
purpose, as a healthy escape if used in proper quantities at the appropriate time (Granic, Lobel, & Engels, 2014).

When exploring the concept of incorporating the gaming mindset into an educational situation, it is also important to understand for the present times why we engage in the play of games. Jane McGonigal (2011), in her book *Reality Is Broken: Why Games Make Us Better, and How They Can Change the World*, explains that we play for very specific reasons. The most basic reason a game may be played is for the purpose of enjoyment. By extension, if a person is choosing to play a game over another activity, or possibly a responsibility, it could be due to the person aiming to escape the pressure or monotony of the avoided task. Another reason we may engage in play is to reduce stress. Some people will use the game as a way to pace themselves throughout their day, alternating between “responsibility,” (or work), and enjoyment (or play) (Cowley, Charles, Black, & Hickey, 2008). By engaging in this play activity, the final possible reason for playing a game is often accomplished. This reason is to improve life satisfaction (Przybylski, Rigby, & Ryan, 2010).

Rather than have all the games in life distract the student from academic task completion, it could theoretically be possible to utilize this gaming mentality to reduce the stress and dread often experienced in beginning to work on an assignment in higher learning (Urh, Vukovic, Jereb, & Pintar, 2015). By making progress on the academic task, the other goals of reducing stress and improving personal satisfaction would occur. In addition, the student would lower the barrier to engaging in the work of their online course and create smaller milestones, which are easier to achieve while progressing towards the completion of the overall academic assignments they may have otherwise been avoiding.

**Personal Reflection: The Beginning**
In the quest to complete a terminal degree, many academic programs identify the writing of a dissertation as the final challenge a student must pass in order to be conferred the title of “doctor” (Glathorn & Joyner, 2005). This challenge is designed to test the doctoral candidate in a variety of ways. One motivation for presenting this reflective writing piece to the field of education research is to highlight how gamifying the process can lead to increases in the abilities a student brings into this particular challenge, identify relevant psychological concepts related to the process of learning and engaging in academic tasks, and then pose important questions to further understanding concerning how we can frame our academic work in a light which encourages passion for the art of academic research and writing, instead of settling for more negative alternatives.

There are two different ways to measure the length of time it took me to move from completing my comprehensive exams and then defending my dissertation. In May of the third year of my doctorate program, I passed my Comprehensive Exam. At this point, the goal of the entire program shifts from mastering the content involved in a Doctorate program in Counselor Education & Supervision, and onto the completion of the dissertation process. I was driven to complete this as quickly as anyone ever had. I knew that I had two more courses to take before entering “Continuous Matriculation,” the phase where many doctoral candidates lose the focus on their degree and move on to “work” in the field. I completed these courses as scheduled with my school, and by the 10th month after comps, I had assembled my dissertation committee and completed my prospectus. Everyone was on board, loved the topic, and we began talking about a 6-month timeframe for me to deliver a literature review and methodology. I was poised to complete the goal, and in record time.
Except, that is not how this story goes. I changed jobs, moving from a director position to a clinical one. Less responsibility would surely lead to more time for me to focus on writing. It did not. I knew what I wanted to write, and how I wanted it to flow, but everything I had written for my prospectus, my research courses, and every other purpose I had ever faced with my topic, it just did not work. My motivation died.

Five months after my prospectus was approved, I had made minimal progress. I decided I would start everything from page one. Same topic, but completely new writing. Nothing re-used; no excuses. After I wrote a few of my favorite topics, I was stuck. I stayed this way until 6-months later. I could not bring myself to write, and I hated that I lacked the time and desire to work in a way that led to tangible progress. The calendar had moved all the way to January of my fourth year in the doctorate program. That is when I decided to use the concept I was researching to conquer this final challenge. I decided to gamify my dissertation.

Flow & the Psychology of Games

Long before video games became a household staple for entertainment, the field of psychology noticed a principle, which is now referred to in our literature as “flow.” Psychological flow is the process of entering a state of consciousness where the actions of a person become so seamless that nothing else appears to matter (Csikszentmihalyi, 2008). A person who experiences the flow state is so in tune with their activity, that concentration rises beyond any relevant or irrelevant worry, and the person becomes unified with the action itself even to the point of being unaware of time. Activities that are known to initiate this form of connection with the participant include dance, play of musical instruments, chess, rock climbing, and also video games among others.
Prior to video games being the simplest way to experience this phenomenon, Csikszentmihalyi wanted to identify the process of enjoyment at its most core principles. The ability of a person to enjoy an activity eventually leads to the perception that an activity is fun. As can be seen in many problems in which counseling or remediation is necessary, the lack of enjoyment in an activity can frequently lead to avoidance of the activity in the first place, even in the face of undesired consequences involved in this decision (Ceyhan, 2011; Kuss, Crook-Rumsey, Kibowski, Wang, & Sumich, 2018). As can be viewed in Figure I, the flow channel explains the movement of a person from a state of boredom to anxiety, with the goal always to be increasing the challenge of a given activity through development of further skill. Once the skills are increased, the challenge will rise. If the challenge is higher than the skill, the person will work to improve their skill until a greater challenge can be attempted. In this way, the person can seize their optimal abilities in the selected life area. This is theoretically reflected in the progression of tasks in academic programs.

Figure 1.

*Psychological Flow Channel*

Adapted from (Csikszentmihalyi, 1975)
Universities which offer E-learning as a delivery method for their programs do so for many reasons. Among these is the desire to improve the motivation of prospective students to participate in furthering their education, while maintaining effectiveness and efficiency across multiple life areas (Urh et al., 2015). Motivation for students to engage in their learning is a key to unlocking the potential for flow within any gamification mechanic. The idea is that the instructor would implement a game mechanic into their course to encourage learning through student engagement and problem solving (Martí-Parreño, Seguí-Mas, & Seguí-Mas, 2016). However, the learner would not identify the activity as hard and unenjoyable work due to the gaming dynamic. The hope would be that the drive to excel would shift from an extrinsic motivation (get a good grade) towards an autotelic motivation (become the best I can at this task because I want to) (Csikszentmihalyi, 1975; Martí-Parreño et al., 2016). This would then move the learner from a reactive learner who is being pushed through the material into a more proactive learner who is driven to excel by their own self (Bíró, 2014).

**How Gamification Works**

Jean Piaget explained how from an early age play is an integral part of a person’s assimilation of new information from the surrounding environment into their developing concepts of themselves within the world (Rowley, Fook, & Glazzard, 2018). In order for something to be considered a game, it typically will involve four elements; a goal, rules, a feedback system, and voluntary participation (McGonigal, 2011). While many people could argue that all of these are involved in higher learning, the final component, voluntary participation, is sometimes lost amongst students at the micro level, which occurs from assignment to assignment. Therefore, while they may be participating in the degree program voluntarily, they lose the autotelic element in the short term because they would rather not be
completing certain tasks. The goal of gamification is to take the principles of why a person would opt to play a game, and grant some of these traits to the often-under-motivating tasks involved in higher education.

The process for gamification of higher learning programs was explained by Urh et al. (2015) by blending the elements of a game with what is necessary and sufficient for such learning-based programming. While online / distanced learning require that pedagogy and delivery of learning material stay acceptable, many other elements of the program can fall to the wayside without finding a way to preserve the intrinsic desire of the student reciprocally engage with their online instructor. Many video games utilize a system where points and health bars are used to instantaneously give the player messages of success and failure. When the points go up, this is feedback that the player action was correct for completing the task. When health diminishes, this is a sign to the player that a mistake was made. Rewards are often visual and trackable, which give additional levels of gratification to the player when correct actions are taken. Games also successfully link small tasks over and over, until a tapestry of correct actions combine to result in improved skill for the player. The person can see their growth over time, as indicated by their powers or numerical markers attached to their character (or avatar). This lets them know how far they have come and allows them to plan for their next challenges based on their mastery of the game. If just a facet of these principles can be adapted into the online learning environment, the student would have an enhanced academic experience in countless areas, some of which would include motivation to continue and complete, engagement, effectiveness, efficiency, knowledge acquisition, and also the experience of flow (Bíró, 2014; Marti-Parreño et al., 2016; Urh et al., 2015).

**Personal Reflection: Climbing the Mountain**
Now it is time to explain how gamifying my dissertation changed everything. I had heard about a few of these apps for gamification of life tasks through the reading for my literature review. I had to make myself accountable. I decided that January that I was going to finish my doctorate in 2016. I started simple with an app called Swipes. The concept for this app is that you create one list of tasks, and as you get to them in your day, you swipe right to mark that you have completed the task, which gives you a positive beep and the satisfaction of now seeing a shorter list. If you need to postpone the task, you can do so by swiping left and then touching the length of the deferment. When you have completed every item on your list, it congratulates you with a picture, a cheerful tone, and a notification of how many days in a row you have been able to accomplish this. I created my first list with only one item; Make Positive Progress.

I remember the first time I noticed that I had a streak of one week. I saw this, and decided to take advantage of the social network sharing features in the app. I was so proud. I had done something that I had never accomplished at previous times when I was motivated. The app allowed me the flexibility to design my own rules (like what constitutes “Positive Progress”), but it also emphasized my choice in the way I lived my life and spent time, which could then be used to make the aforementioned progress. I remember numerous times when I was making coffee so I could sit at my PC and game with my friends, but the phone would beep and remind me to complete my goals for the day. Just like that, my gaming session would become a dissertation session first, until I felt good about my progress for the day. Sometimes, I would write five or more pages, seizing the feeling of flow as the ideas in my mind filled section after section, pulling my resources from Endnote, and knowing exactly where to place them without a second thought. Other days I would find two new articles and read them. A few times, I would turn on
my PC just to complete a paragraph, or even write two sentences. The point is, something is better than nothing, and the app helped me to directly connect with this message.

I soon ran into more complex tasks, which required lists that are more intricate. At those points, I used another app to compliment the improvements I had already made. Enter the app called *Habitica*. This app takes the premises of old-school role-playing games (RPG) and allows you to make very specific lists, earn experience for your avatar character, and become more magical as you accomplish things in the real world. I used this app once deadlines became more nuanced in working with my committee, sending emails to important authors from my literature review, interacting with the IRB, advertising my study online, and so on. I kept going because I had created the large deadline, but I had also created hundreds of smaller deadlines. I could not skip a day unless it was unavoidable. I had two different streaks of 100 days or more that year using *Swipes*, and I made my character in *Habitica* a max-level mage with all the high-difficulty goals I accomplished on time. In addition, I completed my dissertation and graduated before the end of that year.

**Integrating Gamification Apps into Higher Education**

An important consideration when utilizing a gamification app is to understand its processes for providing feedback and progression. For example, what kinds of lists and scoring methods are provided to the user as they move through their day-to-day experience with the app? Next, it is important to find an app which provides feedback in a way that can consistently enable the user to excel in their e-learning process. Also, if the student wants to get into a habit of completing the weekly reading by the second day of the week, can the gamifying app provide this sort of notification? Finally, once an app is identified for use, is it able to be structured by
the course instructor, or is it up to the student to have the initiative to create all these systems on their own?

Although numerous gamification apps exist (Superbetter, Habitica, Task Hammer, Chore Wars, etc.), it is important to choose one which allows for the tasks to be suitable for the overall goal. For instance, Habitica allows the user to create smaller objectives with lower rewards, and then list larger objectives, which are reserved for tasks that provide their avatar with a sizable boost to their experience meter. This app also differentiates between habits, daily tasks, and a to-do list which consists of things which must be completed only once. For students in a graduate program, this can be useful, as it allows for the student to list tasks such as reading the textbook or sending emails in a different manner, as it would list “Complete Week 1 Assignment.” The goal of using a method such as this to conduct their learning process is to help the student connect their larger goal for being in the program (i.e., career advancement) with the smaller tasks which somehow feel disconnected from the process of earning the degree in a few years (such as reading and writing) (Urh et al., 2015).

In maximizing on the RPG roots of the app, Habitica and similar apps seem useful for higher education, as it allows for the formation of groups or guilds, which enables the instructor to create goals which can be pushed out by the system to all people belonging to said group. This can be important for facilitating unique forms of communication between students, each other, and the instructor throughout the conducting of the course. While the traditional method for E-learning would consist of the instructor posting a weekly announcement, the gamification app would allow the instructor to send out a series of linked tasks which show the student instantly what is perceived to be the path for success to complete a given assignment. Instead of a student wondering how to structure the writing assignment, the To-Do list could already consist of a task
for each section, labeled as “Write Section: …” This also allows for the basic questions to be instantly understood, so any question between students and faculty can bypass simple questions, and move straight to questions more involved, such as those related to content or academic processes. As technology continues to develop, more advanced processes for supporting students will become available. Currently, it appears there is a substantive benefit to online instructors (or even classroom-based) to work on integrating gamification principles into the procedures of higher learning.

**Discussion**

The obstacles faced by students in online learning programs can be unique in their ability to take some students focus off the normal supports a student in a traditional campus environment would have. Such supports can include interactions with peers, direct interactions with faculty, comfort level asking questions of varying importance levels, and even formulation of student identity (Hurst, Cleveland-Innes, Hawranik, & Gauvreau, 2013). The pursuit of a degree becomes more efficient when done in an online medium, sometimes at the cost of certain structures which lend themselves to the formulation of this identity. Without this identity, some students may delay work on certain required tasks more easily, lacking a psychological connection between what motivates them to engage in activities from other life areas (such as work, family, etc.), and choosing to complete their academic task. The presentation of an incentive for learning can change the outcome of this decision (Anderson, 2016), which has a profound effect on overall student engagement throughout the medium of their chosen program. Gamification of the online classroom could help to bridge this gap, leading to higher rates of student satisfaction, as well as success.
As with many online tools, the key to integration in the e-learning environment starts with the faculty member. If the instructor believes in the technology, they will find ways to allow the course to maximize itself using the technology (Martí-Parreño et al., 2016). The incentives granted by gamification apps can change the way a student feels about the activity as well. A task which otherwise would have been avoided to the point of procrastination can sometimes be engaged simply through creating a short-term reward to the player within such an app. The presentation of progression and feedback are key to games and are also critical to the education progress. Gamifying the online assignments gives an intermediary form of feedback in between the student beginning the task and submitting it, then also in between submission and receipt of instructor grading / feedback. Progression comes, in an academic sense, in the form of the student engaging increasingly challenging content and completing assignments that match these higher levels of content intensities. However, this also is at a slower pace than what commonly motivates a distanced e-learning student focused on efficiency during their hectic life. Gamification also improves on this deficiency, allowing the student to form an identity around their avatar in the app. They must work on the assignment, so their avatar does not die. Over time, they may even develop a sense of pride in their avatar the same way they would in certain video games which are founded on character creation dynamics (Jin, 2011).
By developing this sense of pride in their tangentially formed student identity (Hurst et al., 2013), a welcome side effect of this form of gamification, it becomes more likely that the state of psychological flow could be achieved while working on their assignments (Csikszentmihalyi, 2008), especially those involving academic writing. Flow is the state of optimal experience, when the activity is engaged to the point where that is what the person is in those moments. This intrinsic form of motivation, to become a master of the content with intentionality, can become more powerful than the external goal of getting a degree, or eventually getting a better job. This is because those goals are long-term, far-off from the present moment when the work must be completed. Gamification helps to focus the student on the short-term goals which can be engaged in the present. These apps have the power to take the psychology of what makes video games fun but apply the principles of reward and feedback to
the classroom. It enhances the behavioral conditioning of our mind to the point where the student will want to learn, without realizing they wanted to all along.

CONCLUSION

Efforts to integrate gamification principles into online higher education courses could result in expanded mechanisms of motivation for certain kinds of students. This process highlights a connection between long-term goals and short-term drive to complete tasks, which often is lacking in self-motivated learning environments. Isolation and extenuated feedback loops between student and professor can be overcome by creating a process for continual reward through the student leveling up their avatar during their online coursework. While a task may seem cumbersome on its own merit, it becomes a source of gratification when the alternate deadlines of the daily task are paired with the desire to survive in the gaming overlay projected onto the learning process. The creativity of the student to survive in the gaming elements can then lead to thriving in the course gradebook, which can improve satisfaction with their course faculty and the academic program overall. As time progresses, gamification resources available to faculty of all teaching styles are expected to evolve. As this occurs, students will only be bound by what work they are willing to put forth to fulfill each type of goal on the macro and micro levels. This article was written to explain one account of using gamification to motivate towards the completion of advanced academic tasks, as well as to present a literature review that explores the connection between student challenges in online learning, motivation for student action, and use of gamification as a tool capable of integration into online learning environments.
